CONTENTS

1. Personal introduction
2. Overview of UK's water management structure and policy & the role of citizens in it
3. Examples of national-scale UK citizen science projects for water management
4. Projects I have been involved in
5. Examples of local-scale UK citizen science projects for water management
6. The UpStream project

Personal Introduction

個人簡介

Background

Research Interests:

- Climate change and its impact on local rainfall extremes
- Short-term rainfall and flood forecasting
- Citizen Observatories
- Computational hydro-meteorology

1999-2005

National Taiwan University
 BSc in Civil Engineering
 MSc in Computer Aided Engineering

2008-2012

Imperial College London
 PhD in Civil & Environmental Engineering

2020-NOW

National Taiwan University
 Assistant Professor in Computer Aided Engineering

2005-2008

ROC Army
 Second Lieutenant
National Taiwan University
 RA in two-phase flow simulation

2012-2020

RAIN++

Imperial College London
 Postdoc in radar signal processing
 Postdoc in urban pluvial flood forecasting

Katholieke Universiteit Leuven
 Postdoc in urban hydrometeorology

Rain++
 Co-founder/hydrometeorologist

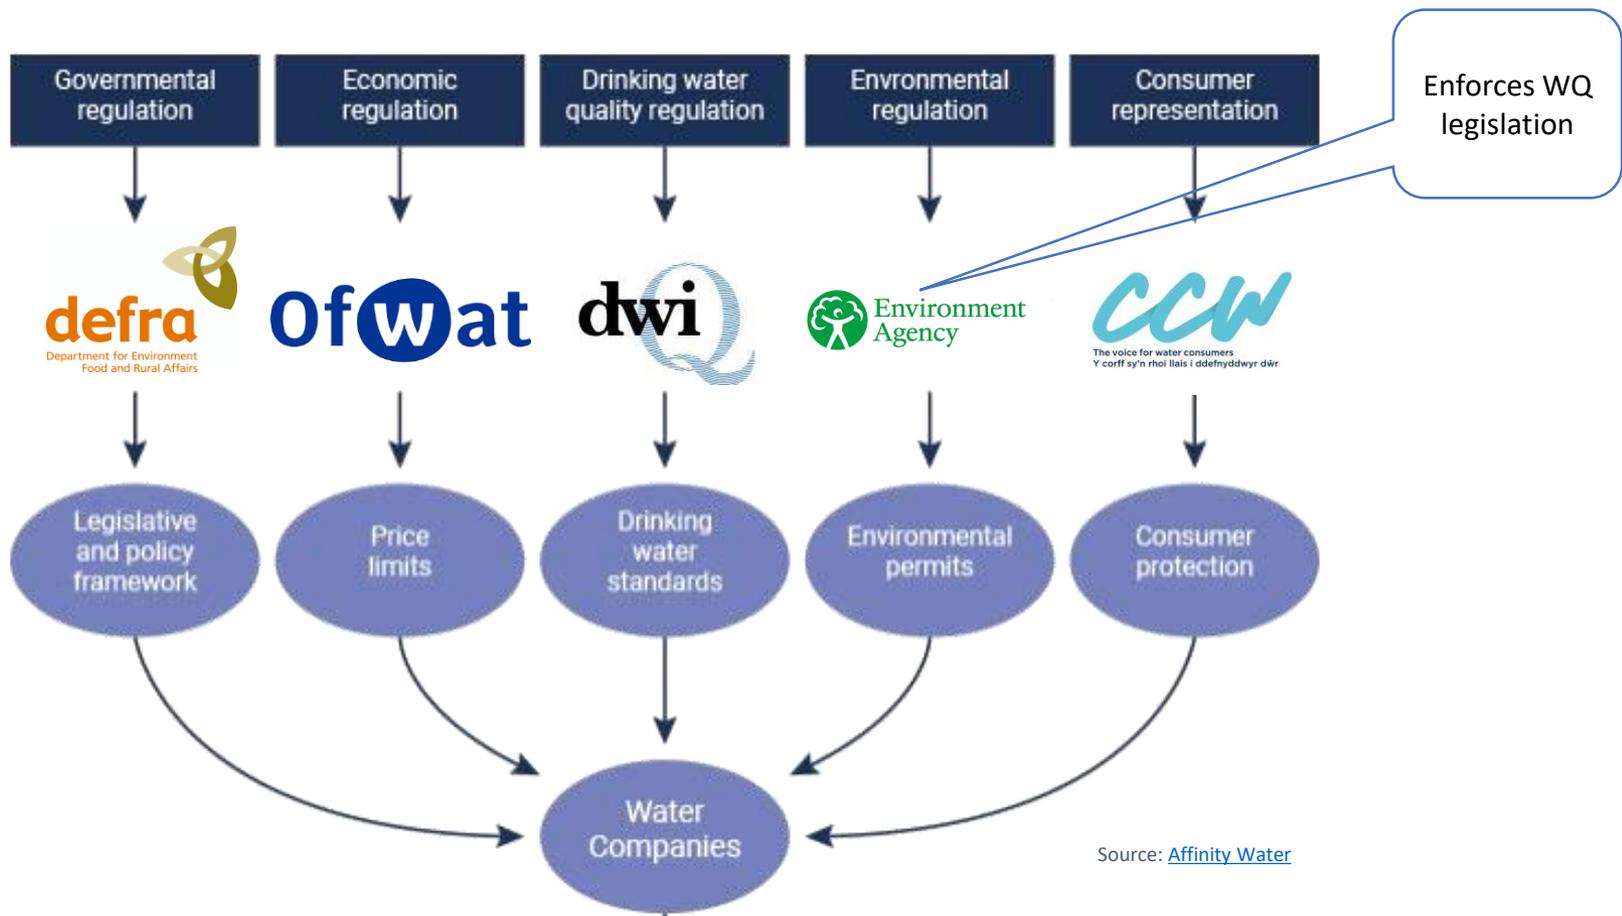

UK Water Management Structure & Policy and the Role of Citizens in It

英國水資源管理架構、政策，及
公民參與

UK Water Management Structure

Water companies were privatised in 1989 -> Private capital injection

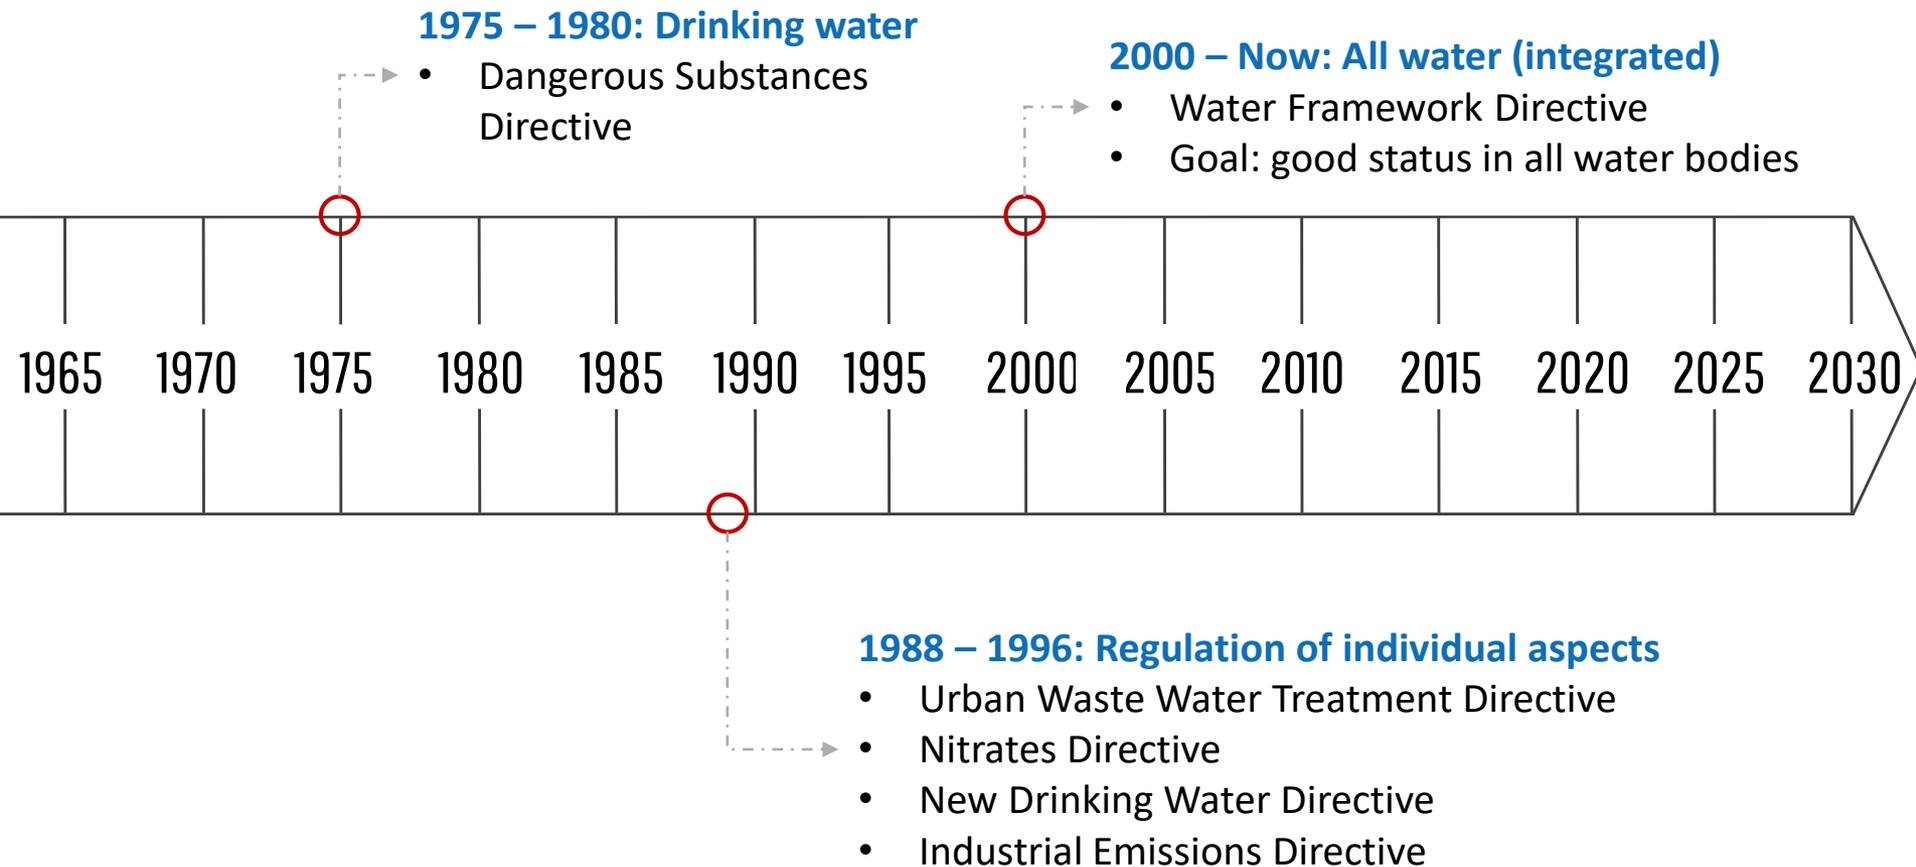

Two types of companies:

- Water supply and sewerage services
- Water supply-only

They are a monopoly, therefore strong regulation required

Development of European (& UK) Water Policy

Focus on WQ

European (& UK) Water Policy – Current State

Largely shaped by WFDs

- Integrated approach (quantity + quality)
 - From separate to integrated systems
 - E.g. the impact of drought to water quality
- Consistent approaches to water management
- River basin-based water management
 - Break administrative borders
 - Natural catchment border
 - With a common goal
- Public participation at its core

The water framework directive

social priorities in these plans.

UK independent legislation going forward; however, overarching EU directives have fundamentally shaped UK water management and are enshrined in local law

UK Water Management Policy

Other relevant laws and planning instruments (with a focus on water management; not an exhaustive list!):

- **Environmental Permitting Regulations (2010):**
 - Gave further effect to the WFD by defining water discharge offences and associated penalties
 - Penalties include unlimited fines and up to 5 years imprisonment
- **Flood and Water Management Act 2010**
 - Provisions about water management, including management of flooding and erosion risks
 - Clarification of water management roles, in response to localised (rainfall-driven) flooding in 2007
- **Climate Change Act (2019):**
 - Commits the UK to 'net zero' by 2050 - **First major economy to legislate for net zero**
 - **Great implications for efficient water management**
- **Sewage (Inland Waters) Bill (2019-2021 – under review):**
 - Duty on water companies not to discharge untreated sewage into rivers
- **First river designated as bathing site (2020):**
 - This means tighter standards and closer monitoring
 - Citizen victory!
- **DEFRA-led Storm Overflows Taskforce:** to ensure that storm overflows cause no harm to receiving waters
- **Environment Bill (under review)**
 - Will bring into UK law environmental protections and recovery, inc. governance framework & standards
 - Expected to place a duty on water companies to reduce discharges from storm overflows

**25 Year
Environment
Plan (YEP)
(2018)**

*To improve the
environment
within a
generation*

25 Year Environment Plan (25 YEP)

- “Aim to deliver cleaner air and water in our cities and rural landscapes, protect threatened species and provide richer wildlife habitats”
- Living document: will continue to evolve and be updated as policies develop
- Calls for increased public engagement with the environment

25 Year Environment Plan (25 YEP)

- 10 boarder themes, 16 headlines, 66 indicators

| | | |
|-------|-----------|--|
| WATER | B1 | Pollution loads entering waters |
| | B2 | <i>Serious pollution incidents to water</i> |
| | B3 | <i>State of the water environment (headline 3)</i> |
| | B4 | <i>Condition of bathing waters (headline 3)</i> |
| | B5 | Water bodies achieving sustainable abstraction criteria (headline 3) |
| | B6 | Natural functions of water and wetland ecosystems |
| | B7 | Health of freshwaters assessed through fish stocks |

| Themes | Headlines | Goals |
|---|--|---|
| A. Air (A1-A7) | 1. Air quality (A1,A3) | Clean Air |
| | 2. Greenhouse gas emissions (A2) | Mitigating Climate Change |
| B. Water (B1-B7) | 3. Water and the water environment (B3,B4,B5) | Clean and plentiful water |
| C. Seas and Estuaries (C1-C11) | 4. Diversity of our seas (C3,C4,C5) | Thriving plants and wildlife |
| | 5. Health of our seas (C7,C8) | |
| D. Wildlife (D1-D7) | 6. Wildlife and wild places (D2,D5) | Efficient use of natural resources |
| | 7. Nature on land and water (D1,D4,D7) | |
| E. Natural Resources (E1-E9) | 8. Production and harvesting of natural resources (E1,E3, E4, E7) | Reduced risk from environmental hazards |
| F. Resilience (F1-F4) | 9. Resilience to natural hazards (F1,F2,F3) | |
| G. Natural beauty and engagement (G1-G7) | 10. Landscapes and waterscapes (G1,G2,G3) | Enhanced beauty and engagement |
| | 11. People enjoying and caring about the natural environment (G4,G5,G6,G7) | |
| H. Biosecurity, chemicals and noise (H1-H4) | 12. Exotic diseases and invasive non-native species (H1,H2) | Enhancing biosecurity |
| | 13. Exposure of people and wildlife to harmful chemicals (H3,H4) | Managing exposure to chemicals |
| J. Resource use and waste (J1-J6) | 14. Resource efficiency and waste (J2,J4,J5,J6) | Minimising waste |
| K. International (K1-K4) | 15. Impacts on the natural environment overseas (K1) | Global impacts |
| | 16. Improving the environment overseas (K2, K3,K4) | |

Beyond water security

Water as a key ecosystem and amenity asset

25YEP Implementation

Implications for citizen engagement

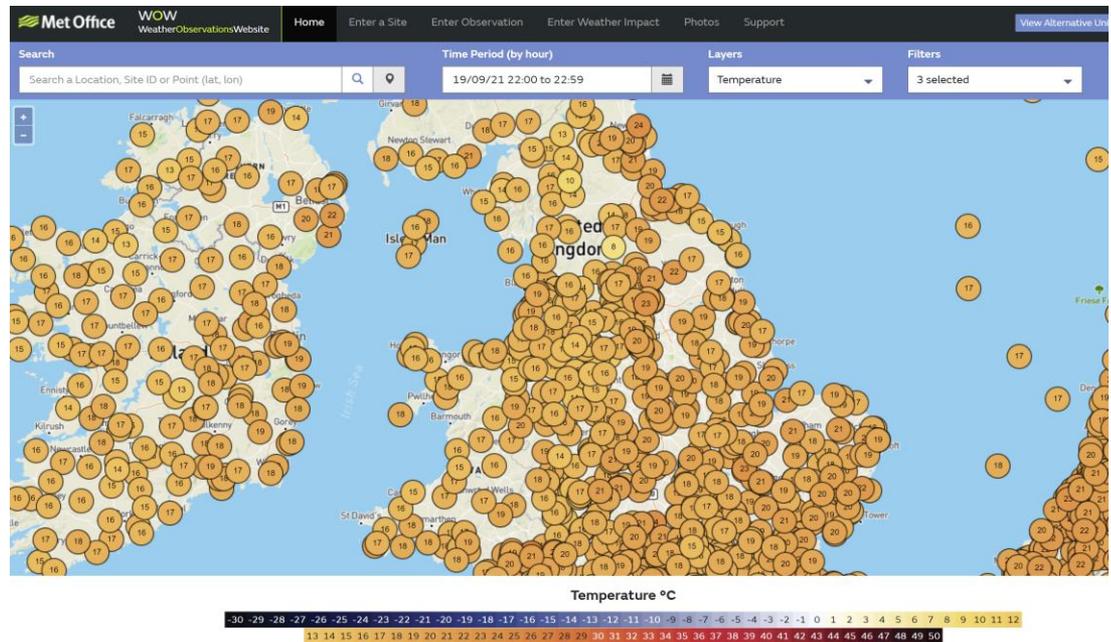

- Freshwater is a key natural asset and its **monitoring is crucial** for 25YEP delivery.
- Freshwater indicators are well defined, but **regular monitoring at national scale is extremely challenging**.
- **Citizen science** has the potential to **help overcome monitoring gaps** while also **helping people connect with the environment**.
- **Freshwater monitoring** presents a **unique opportunity** for **piloting of citizen science**.
- **Environment Agency's (EA) SENTINEL Tool (under development):**
 - Aimed at bringing together citizen science data with EA monitoring data
 - To enable improved understanding of the freshwater environment

Example of similar tool

Met Office Weather Observations Website (WOW)
<https://wow.metoffice.gov.uk/>

- “A platform for the sharing of current weather observations from all around the globe, regardless of where they come from, what level of detail or the frequency of reports”.
- Launched in June 2011
- Brings together Met Office, EA and citizen weather observations
- Comprehensive guidance for amateurs

Summary - Key points

- Switch to **integrated water management** over recent decades
- Focus **beyond water supply** – freshwater as a valuable natural asset with vital ecosystem and amenity benefits
- Recently, **great pressure on river (inland) water quality**, including on reduction of **sewage discharges**
- **Increasingly important role of citizen engagement and citizen science projects**, with multiple benefits arising from it
 - Citizens can help overcome monitoring gaps
 - Improved people's connection with the environment -> Public health and wellbeing benefits

Examples of national-scale UK citizen science projects for water management

英國公民參與水資源管理案例分享

FreshWater Watch (FWW)

Part of EarthWatch Europe

<https://freshwaterwatch.thewaterhub.org/>

- Monitoring phosphates and nitrates with standardised chemical Pack Tests (FWW Pack Tests).
- Replicate (and simplify) standard lab method comparable to EA monitoring.
- 1500 – 2000 measurements per year since 2012.
- > 85% accuracy

- WaterBlitz

The screenshot shows the website's header with the 'earthwatch EUROPE' logo and navigation links: 'About', 'Projects', 'Our data', 'Support us', 'Donate', 'Language', and 'Log in'. The main content area features a photograph of two people in a natural setting, one holding a test kit. Text overlay reads: 'WaterBlitz Autumn 2021', 'Thames, UK | Eindhoven, The Netherlands', and 'Be a citizen scientist. Test water quality near you.' A 'Find out more' button is positioned below the text.

Angler's Riverfly Monitoring Initiative (ARMI)

Part of The Riverfly Partnership

<https://www.riverflies.org/rp-riverfly-monitoring-initiative>

- Standardised sampling and recording of aquatic benthic invertebrate communities to produce a ARMI index.
- ARMI is directly comparable to EA monitoring
- Over 2500 sites monitored nationally per month.
- ARMI index = a simplified version of the Biological monitoring working party (BMWP) index

- ~ 0.86 correlation

About / Projects / Anglers' Riverfly Monitoring Initiative (ARMI)

Anglers' Riverfly Monitoring Initiative (ARMI)

Anglers' Riverfly Monitoring Initiative (ARMI)

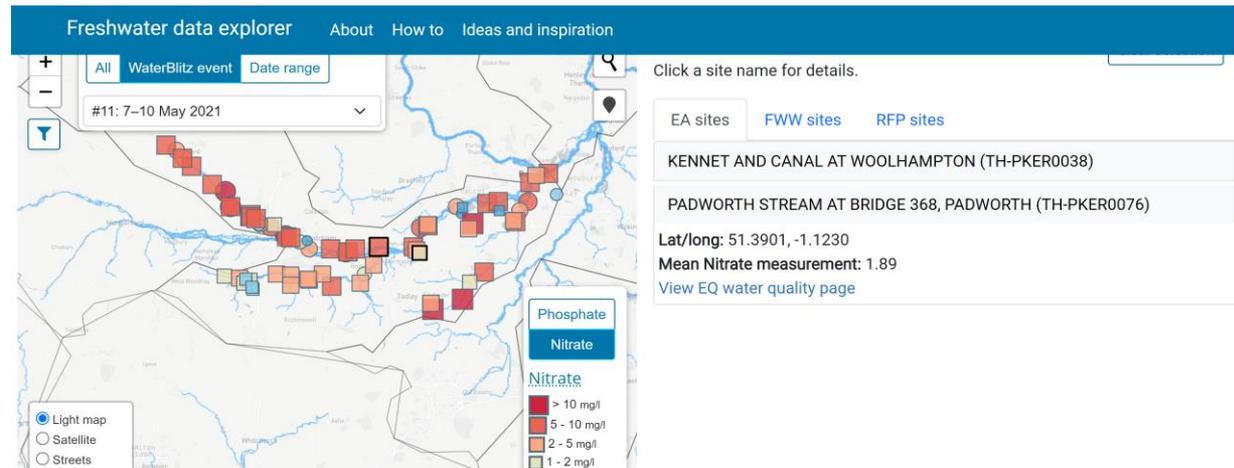

Anglers and local community groups are often seen as natural guardians of the river environment, because they are in an ideal position to monitor the health of the watercourses they fish and live near. The Anglers' Riverfly Monitoring Initiative (ARMI) has been pioneered by the Riverfly Partnership to provide a simple, standardised monitoring technique which groups can use to detect any severe perturbations

Common success factors & challenges

- Work closely with the EA, co-design or provide comparable measurements to the EA monitoring
- Comprehensive and interactive data platform
- Global extent
- Quality assurance
- Oversampling in space and time

| Latest Stats | | | | | | | |
|-------------------|-------|-----------------------|------------------|-------|--|--|--|
| Riverflies Survey | | | | Stats | | | |
| Monthly Records | 228 | Records Pending | 715 | | | | |

Projects I have been involved in

公民科學研究計畫：
個人經驗分享

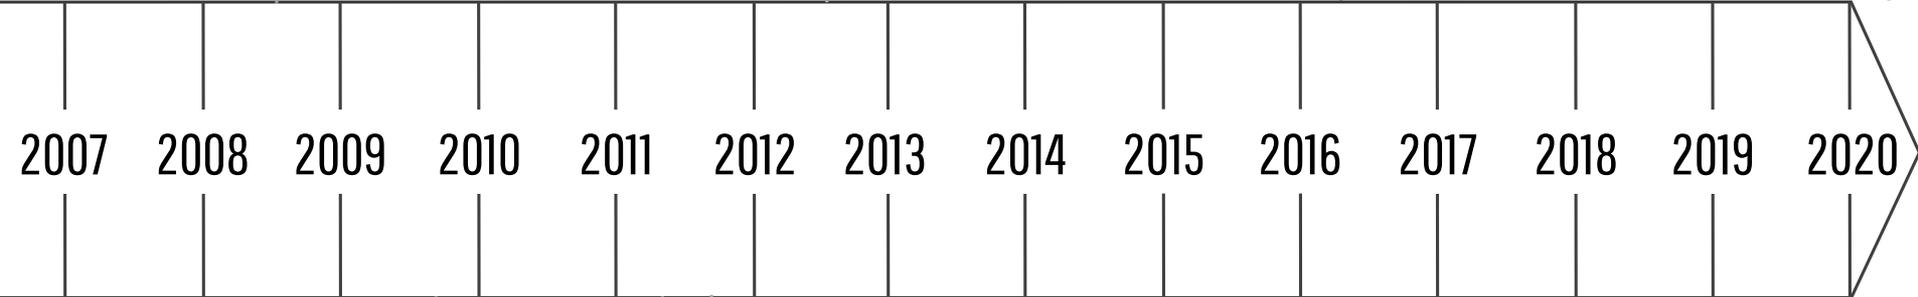

Projects

FRMRC flood risk management research consortium

FloodCitiSense

DIANE-CM

Rain Gain

2007 UK summer floods

DIANE-CM (2009-2011): Collaborative modelling for active involvement of stakeholders in urban flood risk management (UK & Germany)

Collaborative flood risk management supported by:

- Novel flood modelling and mapping techniques
- Web-based collaborative decision making support tools

| GROUP RANKING | | |
|---------------|------|-------|
| Alternative | Rank | Score |
| 1 | 5 | 16.49 |
| 2 | 4 | 28.39 |
| 3 | 3 | 39.80 |
| 4 | 1 | 38.83 |
| 5 | 2 | 29.72 |

Key findings:

- Shared knowledge development
- Improved understanding and acceptance of flood management strategies
- Increased awareness and personal responsibility

Challenges: Apathy, wider and more varied stakeholder engagement, high turnover rates, long-term engagement.

COLLABORATIVE MODELLING APPROACH

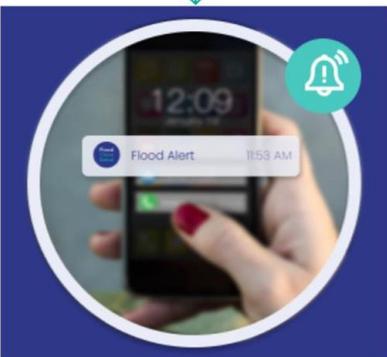

COLLABORATIVE URBAN FLOOD MONITORING AND ALERTING

(2017-2020) <http://www.floodcitisense.eu/>

By and for citizens and city authorities

REPORT AN INCIDENT

Incident 10/11/20 12:13

Map

MODELLING OF PLUVIAL FLOODS

PREDICTION Water levels/flows (in real-time)

THRESHOLDING FOR FLOODING

FLOOD WARNING

Various ML flood prediction models

Lessons I have learnt

- It is essential to **engage all relevant stakeholders from onset**, including government agencies -> thus ensuring that all needs are accounted for and that project outcomes can have real application and impact.
- **Clear communication and expectation management** is key.
- **Robust technologies** must underpin citizen science projects. Fragile or difficult to use technologies discourage citizen engagement .
- **Data reliability and trustability** is a common challenge in citizen science project – Adequate data validation can help overcome this (e.g. through comparison against standard/recognised sensors).
- **Long-term engagement remains a challenge**. Good data utilisation (answering relevant questions, providing relevant services) alongside communication and technology support can help address this.

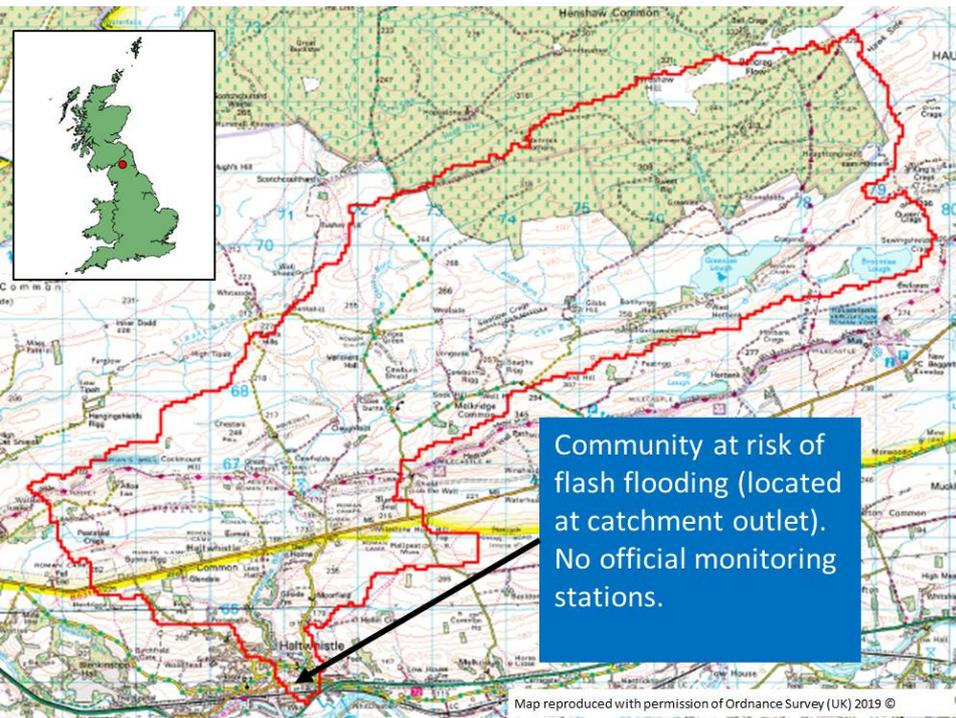

Examples of local-scale UK citizen science projects for water management

Citizen science for catchment science: A rural case study from Northumberland

1. Haltwhistle Burn catchment, Northumberland, UK

eleanor.starkey1@ncl.ac.uk

1. Haltwhistle Burn catchment, Northumberland, UK

Project Background About the Catchment **COMMUNITY HUB** Volunteer Gallery News & Events Further

Haltwhistle Burn Community Mapping

Double click to zoom in, click red squares to get information at location

1 sourced flood data from smartphones and tablets.

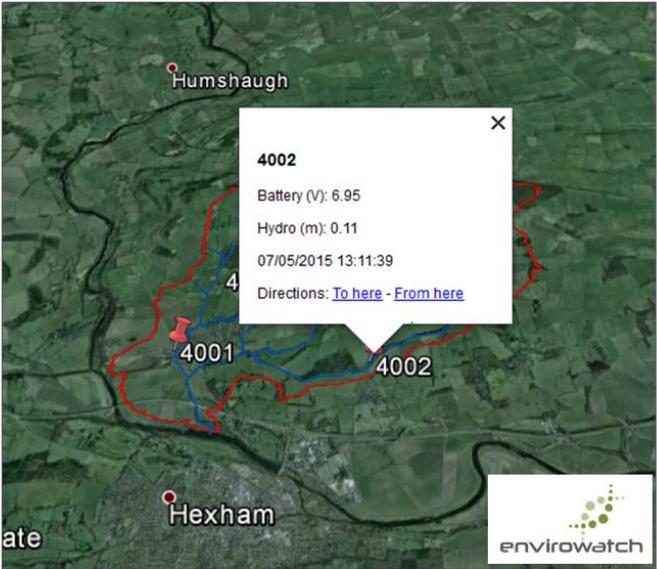

<https://research.ncl.ac.uk/haltwhistleburn/> @HaltwhistleBurn

2. Action4Acomb, Northumberland, UK

- Community flood groups and flood plans – taking responsibility at a local level
- Community-led & community-owned water level sensors (real-time) provide flood wardens early warning information

<https://action4acomb.co.uk/>

Flooding

If you observe a FLOOD please telephone **01661 400200** on:

01661 400200

By calling this number, Flood Wardens in Acomb can activate the Community Flood Plan to assist residents and visitors

If at any time there is a danger to life
 Call the Emergency Services
 on **999** or **112**
N.B. Inform the controllers that there is poor mobile phone coverage at Acomb

The Red Burn which flows around Acomb has overtopped at least 5 times since 1996 and flooded properties in 2008 and then again in 2012. The Birkey Burn to the south of the village has also broken its banks a number of times in the same period and flooded Garden House Farm in 2008.

These 'flash floods' can be sudden and serious and could happen again.
 Some simple reminders should help you if there is another flash flood.

Flash Flooding
Don't get caught out. Be prepared.

Be aware and know the signs

Do not drink or walk through flood water

Plan where to go if you get caught in a flash flood

Revised 2014

eleonor.starkey1@ncl.ac.uk

2. Action4Acomb, Northumberland, UK

Manual rain gauge observed at 9am each day by citizen scientists

Automatic weather station (design used by 'professionals')

Acomb First School, Northumberland, UK. Comparing different rain gauges

3. National Green Infrastructure Facility, Newcastle University, UK

Citizen science – help monitor the swale!

Swales are characterised by shallow, open and vegetated ditches which can offer multiple environmental and social benefits within the urban environment, including reduced flood risk.

Help build up a picture of how the swale behaves and changes over time. Here's what to do:

1. Align your feet with either the red or blue footprints on the pavement.
2. Take a photograph of the wetland (📷) and experiment areas (📷) during different weather conditions. **Please stay on the footpath and stay safe.**
3. Share your data with researchers and the local community. Either:
 - Tweet your observations to @NGIF_UK (#Swale)
 - OR
 - Upload your observations using the webform QR code.
 Ensure your observations include a date and time.
